```
接收client请求
                                  NettyServer # doOpen()
   final NettyServerHandler nettyServerHandler = new NettyServerHandler(getUrl(), this);
                            NettyServerHandler # channelRead()
                              handler.received(channel, msg);
                                 AbstractPeer # received()
                                handler.received(ch, msg);
                             MultiMessageHandler # received()
                            handler.received(channel, message);
                               HeartbeatHandler # received()
                            handler.received(channel, message);
请求分发给线程池
                              AllChannelHandler # received()
                      executor.execute(new ChannelEventRunnable(...));
                               ChannelEventRunnable # run()
                            handler.received(channel, message);
                                DecodeHandler # received()
                            handler.received(channel, message);
```
